

# Spectra Flash Colors™

---

Flashing a kiln can be inconsistent, costly, and destructive to kiln furniture. The purpose for this is purely cosmetic.

Our **Spectra Flash Colors™** have been formulated to mimic the colors and effects produced from kiln flashing.

By applying these colors to the brick before firing, brick producers gain control and versatility not possible in the kiln.

The number of flashed brick in a cube can be as high or as low as the manufacturer desires.

The range of colors can be as varied as the imagination, not limited by the clay color or kiln control.

Flash colors come in a range of hues, some with shiny effects such as Onyx or Cocoa.

They come ready to mix with water and require no additional materials or chemicals.

Application can be by spraying or the creative use of pump & roll equipment.

The key is to get the materials onto the brick in a varied pattern that will simulate a flash.

Southern Color has experience with different methods and can assist with on site plant trials.
